

ENG 101
LESSON 15

Answer the following by writing true or false.

☐ T☐ F

1. This table refers to the percentage of the total United States population.

☐☐

2. Judging from the table, the annual death rate has been reduced by slightly less than half since 1900.

☐☐

3. Heart disease has consistently been the major cause of death.

☐☐

4. The death rate for infants in 1977 was 10.7 percent.

☐☐

5. Typhoid fever has been completely eliminated as a cause of death.

☐☐

6. Since 1940 the annual death rate for automobile accidents has remained about the same.

☐☐

7. The reduction in deaths since 1900 has been greater for tuberculosis than for pneumonia.

☐☐

8. The annual death rate for cancer was about $2\frac{1}{2}$ times greater in 1977 than in 1900.

☐☐

9. The most serious childhood disease in the first part of the twentieth century apparently was typhoid fever.

- ☐ ☐ 10. The abbreviation *n.a.* means “Not Applicable.”

Answer the following questions by writing *true* or *false*.

- T F
- ☐ ☐ 1. This graph shows the number of speakers of all the important languages of the world.
- ☐ ☐ 2. The number of speakers is shown on the vertical axis.
- ☐ ☐ 3. The number of speakers is indicated in millions. e.g, 100 means 100,000,000.
- ☐ ☐ 4. There are twice as many speakers of English as of French.
- ☐ ☐ 5. Two languages are spoken by more than 300 million speakers.

Answer the following questions by writing on the lines provided.

1. About how many native speakers of English are there in the world?
_____.
2. What languages have about as many speakers as Arabic?
_____.
3. What dialect of Chinese has the most speakers?
_____.
4. There are about twice as many speakers of Hindi as of
_____.
5. Which language ranks fifth in total number of speakers?
_____.

1. Japan is composed of four major islands. The biggest island is *Honshu*. What are the names of the other three?

Which island is northernmost? _____ southernmost? _____

2. Japan is surrounded by an ocean and three seas. Name the ocean _____. Name the seas _____.

Which sea is to the west of Japan? _____ to the southeast? _____

3. What is the country nearest to Japan? _____ How far is it from Japan? _____

4. What other countries are close to Japan? _____
Approximately how far are these countries from Japan?

What direction are they from Tokyo? _____

5. How far is the island of Hokkaido from the Soviet Union?

Which direction is Hokkaido from the Soviet Union?

_____ Which direction is Hokkaido from Korea? _____

On Hokkaido, name one city that is due west of Kushiro: _____ and one that is due north of Hakodate: _____

6. How many cities in Japan have a population of 1,000,000 or more? _____ What are their names? _____. How do you know which ones they are? _____

7. Approximately how far is Nagoya from Tokyo?

_____. Nagoya is to the _____ of Tokyo and to the _____ of Osaka.

8. The latitude of Tokyo is 35. What is the longitude?

9. What are the latitude and longitude of the northern tip of the island of Hokkaido? _____

10. Approximately how far is it from the southern tip of Kyushu to the northern tip of Hokkaido? _____.

Mutsu Bay is at the _____ tip of Honshu. The city of Nagasaki is at the _____ tip of Kyushu.

True or False:

Study the charts again and say whether the following statements are True or False.

☐ ☐ A. In Asia the production of softwood timber is more important than the production of hardwood timber.

☐ ☐ B. The largest produces three times as much paper pulp as Europe.

☐ ☐ C. Asia produces three times as much paper pulp as Europe.

☐ ☐ D. The producers of timber are shown on the vertical axis of the graph.

☐ ☐ E. The cubic meters of wood produced are indicated in millions; for example, 50 means 50,000,000 cubic meters.

1.By adding the ending-er and -est to words of one syllable

Examples

ABSOLUTE COMPARATIVE SUPERLATIVE

Adjectives	old big	new older bigger	newer newest oldest biggest
Adverbs	soon late	sooner later	soonest latest

2.By placing the words more and most in front of words with three or more syllables

Example

ABSOLUTE		COMPARATIVE		SUPERLATIVE	
Adjectives	interesting	more interesting	most interesting		
	convenient	more convenient	most convenient		
	beautiful	more beautiful	most beautiful		
Adverbs	easily	more easily	most easily		
	carefully	more carefully	most carefully		

Example

ABSOLUTE		COMPARATIVE		SUPERLATIVE	
-y	happy funny	happier funnier		happiest funniest	
-ly	early friendly	earlier friendlier		earliest friendliest	
-ow	shallow narrow	shallower narrower		shallowest narrowest	

common	commoner more common	commonest most common
handsome	handsomer more handsome	handsomest most handsome
polite	politer more polite	politest most polite
quiet	quieter more quiet	quietest most quiet

Example

	Absolute	Comparative	Superlative
Adjectives	bad far furthest/farthest good many	worse further/farther better more	worst best most
Adverbs	badly	worse	
	worst		
	fair	further/farther	
	furthest/farthest		
	little	less	least
	much	more	most
	well	better	best
are similar	as many ...as	equal to	as...as each

as much ... as
the same...as
Similar to

is like all
similar/ly
equal/ly alike

the same

compare to/with

Non-equivalence

The following words and/or constructions are used to show non-equivalence (I.e. not the same).

as	not as ... as	greater than	unequal (ly)
	word + er than	not as much... as	unlike
	more... than	neither ...nor ...as	not the same
	fewer ... than	not as many ...as	not all
	less ... than	not equal to	

1- The early 1970s saw the birth of the microcomputer, or micro for short. The central processor of the micro, called the microprocessor, is built as a single semiconductor devices; that is, the thousands of individual circuit elements necessary to perform all the logical and arithmetic functions of a computer are manufactured as a single chip. A complete microcomputer system is composed of a microprocessor, a memory and peripheral equipment.

The processor, memory and electronic controls for the peripheral equipment are usually put together on a single or on a few printed circuit boards. Systems using microprocessors can be hooked up together to do the work that until recently only minicomputer systems were capable of doing. Micros generally have somewhat simpler and less flexible instruction sets than minis, and are typically much slower.

Different micros are available with 4-, 8-, 16- bit word lengths. Similarly, minis are available with word lengths up to 32 bits. Although minis can be equipped with much larger primary memory sizes, micros are becoming more powerful and converging with minicomputer technology.

2- The extremely low price of micros has opened up entirely new areas of application for computers. Only 20 years or so ago, a central processing unit of medium capability sold for a few hundred thousand dollars (U.S.), and now some microprocessors sell for as cheaply as \$10. Of course, by the time you have a usable microcomputer system, the price will be somewhere between \$500 and \$10,000 depending on the display unit, secondary storage, and whatever other peripherals are needed.

3- The available range of microcomputer systems is evolving more rapidly than minicomputers. Because of their incredibly low price, it is now possible to use only a small fraction of the computer's capability in a particular system application and still be far ahead financially of any other way of getting the job done.

For example, thousands of industrial robots are in use today, and the number is growing very rapidly as this relatively new industry improves the price and performance of its products by using the latest microcomputers.

4- Even though the software available for most microcomputer systems is very-limited - more so than for minis- it does not discourage their use in the many high-volume, fixed applications for which programming is essentially a 'one shot deal' as is the case in the space shuttle program.

In addition to their extensive use in control systems of all types, they are destined for many new uses from more complex calculators to automobile engine operation and medical diagnostics. They are already used in automobile emission control systems and are the basis of many TV

game attachments. There is also a rapidly growing market for personal computers whose application potential in education is only just beginning to be exploited.

5- It would seem that the limits for microcomputer applications have by no means been reached. There are those who predict that the home and hobby computer markets will grow into a multi-billion dollar enterprise within a decade or so. It would also appear that performance of microprocessors could well increase ten-fold before 1990 while prices for micros could decrease by as much.
